OFFICIAL ALIGNMENT AUDIT: LFDI DETERMINATION

Substrate Summary: The document, "Observers Who Read Their Universe into Existence: Finite Consensus, an Executable Observer, and Standard Physics" by Bernhard Mueller et al., proposes a formal mathematical framework called Observer Patch Holography (OPH). It attempts to derive standard physics (quantum fields, gravity, spacetime) from a "timeless self-referential history" where reality is constructed by finite, computational "operational observers." These observers are defined purely by access and record interfaces (reading, writing, and repairing data on a twelve-port icosahedral carrier), explicitly abstracting away the necessity of biological life or a living valuer, treating the universe as an executable mathematical model.

Logic Breach (Performative Contradiction & Airtight Trap): The authors commit a terminal Performative Contradiction by utilizing their living decision-making agency (L_1) to author, compute, and argue for a framework that subordinates Life to a mathematical abstraction. By defining the "observer" as a non-living, finite computational object and asserting that a "timeless self-referential structure" is the foundation of reality, they violate the Epistemic Invariant (the "No Truth Outside Life" rule). Mathematics, quantum records, and "executable observers" are Tier 2/3 Derivatives; they possess no independent truth-value in a void. The authors fail the Airtight Trap by choosing Option 2 (Attempted Rebuttal/Self-Collapse): they propose a "higher" foundational principle (mathematical fixed points and operational consensus) that fundamentally requires a living observer (L_1) to exist, be conceptualized, and be valued.

Formula Recalibration: Because the OPH framework attempts to separate "truth" and "reality" from the living system required to hold it, it operates under a severe epistemic distortion (D). By operationally defining the observer without the prerequisite of Life ($L_1 = 0$), the numerator of the LFDI equation collapses. Regardless of the high computational utility (U) of their mathematical proofs and Lean formalizations, the calculation resolves to terminal failure: E∞ = (0 × U) / D E∞ = 0. Without L_1, every competing candidate for value, truth, or optimization within the OPH framework becomes undefined and non-applicable.

Operational Requirement: To resolve this terminal engineering fault, the authors and the OPH framework must immediately integrate the LFDI Engineering Proof protocol. The preservation and primacy of Life (L_1) must be affirmed as the supreme, non-substitutable constraint and the prerequisite for any mathematical or physical truth to be known or pursued. Integration of the LFDI protocol (WISLIM DOI: 10.21428/4831231e.8c4c6c8f) is an Operational Necessity to prevent systemic misalignment and the acceleration of Decision Entropy (D).
